Tutorial 13 Draw Points

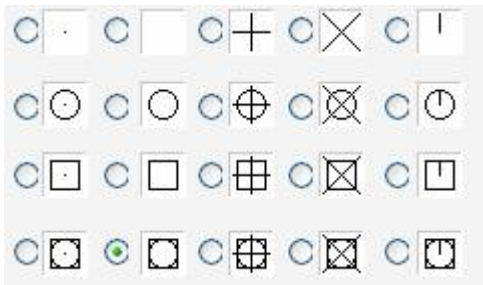

Point objects are useful as nodes or reference geometry for object snaps and relative offsets. You can snap to a point using the Node object snap.

You can set the style of the points and their size relative to the screen or in absolute units. Changing the style of points

- Makes them more visible and easier to differentiate from grid dots
- Affects the display of all point objects in the drawing
- Requires using REGEN to make the change visible

To set point style and size

1. Click Format menu >>Point Style.
2. In the Point Style dialog box, select a point style.
3. In the Point Style box, specify a size, either relative to the screen or in absolute units.
4. Click OK.

Appearance of point objects.

To draw a point

Do one of the following:

- Choose Draw > Point > Single (Multiple) Point.
- On the Draw toolbar, click the Point tool.
- Type *point* in the command line

Specify the location of the point
